Definiation:-

Pre-eclampsia - B.P. over 135/85 mm.Hg. with oedema and/or proteinuria when B.P. in early pregnancy is known to be normal.

Unclassified toxæmia - all cases booked after 20th week of pregnancy and in whom the normal blood pressure is unknown.

Group 'A' - when the B.P. on discharge is normal.

Group 'B' - when the B.P. on discharge is more than 135/85 mm.Hg.

RUPTURE OF UTERUS

Non-booked Case Serial No.4207/78 Age: 44 G: 8 P: 7

The grandmultiparous patient was transferred from St. John's Hospital on an outlying island, Cheung Chau, because of absence of foetal heart and sudden onset of constant abdominal pain. She had been in labour for six hours. On arrival, the patient was in shock, with marked abdominal tenderness and rebound tenderness. Foetus was in transverse lie with foetal parts easily palpable and no foetal heart was detected. Diagnosis of rupture of uterus was made, and emergency operation performed which confirmed the diagnosis. A fresh stillborn foetus weighing 4110 gm was in the peritoneal cavity. Hysterectomy, bilateral salpingectomy and right oophorectomy were performed. She made an uneventful recovery.

CASE OF SPECIAL INTEREST

Booked case Serial No.:4097/78 Age: 27 G: 4 P: 0

The patient had 2 spontaneous abortions and an ectopic pregnancy.

She had an uneventful antenatal course. At 41 weeks, she went into spontaneous labour. The first stage lasted 4 hours, and was without any complications. A male baby of 3300 gm was delivered. She was never catheterised.

On 5th day of pospartum, she had a sudden attack of central abdominal pain, which shifted to the right lower quadrant. She was transferred to the Government Surgical Unit of Queen Mary Hospital and a laparotomy was done for suspected appendicitis.

There was extravasation of 4 litres of urine from the peritoneal cavity and a 3 cm transverse laceration at the dome of the urinary bladder. No gross pathology was detected in the bladder. The perforation was repaired and a Foley's catheter was inserted. Incidentally left dermoid cyst of 6 cm diameter was found and left salpingoophorectomy was performed. The right tube and ovary were normal.

She was discharged well on the 5th postoperative day.

MATERNAL DEATH

Booked case Serial No.223/78 Age: 42 Gravida: 5 Para: 4

The patient was mentally retarded and had lower segment Caesarean section done in her first pregnancy. It was followed by 3 normal spontaneous deliveries in the subsequent years.

During the present pregnancy, she first attended the antenatal clinic when the uterus size was about 34 weeks. She could not remember her L.M.P. Toxaemia developed near term. She was admitted. At this time, X-ray abdomen showed a foetus of 38 weeks' maturity. Amnioscopy was started on alternative days and no abnormality was detected.

The X-ray pelvimetry showed gynaecoid pelvis of good shape and adequate pelvis measurements. The patient was allowed to have a trial of scar at the onset of labour. Labour started spontaneously at clinical maturity of about 39 weeks. The first stage lasted for 2 hours 35 minutes. Membrane remained intact at the end of the first stage. The second stage lasted for 5 minutes. A male baby B.W. 2900gm was delivered with Apgar score of 7 in 1 minute. The placenta was delivered complete by fundal pressure. At the end of the second stage, patient started to gasp and was noted to be slightly cyanotic.

The patient suddenly became unconscious and had cardiac arrest. The heart rate failed to return despite resuscitative measures such as I.V. adrenaline, I.V. calcium and NaHCO₃, cardiac massage and artificial respiration. Continuous vaginal bleeding was noted during resuscitation. The use of syntocinon infusion, fibrinogen, blood transfusion and uterine massage failed to stop the bleeding. Haematuria was also noted. Coagulation tests results were gross abnormal. Diagnosis of amniotic fluid embolism was made. The patient died 1 hour after delivery of the baby.

The baby had neonatal jaundice on Day 5. Jaundice subsided on Day 10 after phototherapy. The baby was discharged well on Day 23.

Autopsy on the mother showed:-

- Amniotic fluid embolism
- Clinical shock and uterine bleeding
- Right heart dilatation
- Systemic venous congestion.
